

**Sept 23. 10:10–10:35 |
Attacks on Critical
Infrastructures (SME):
Reasonable Cybersecurity**

Speaker: Dr. Vilius Benetis,
Director at NRD Cyber Security,
Lithuania

Focus

- Cybersecurity operations build-out
- Incident detection and handling
- Establishment and support of Computer Security Incident Response Teams (CSIRTs) and Security Operation Centres (SOCs)
- Cyber capacity building for organisations, sectors, and nations

Customers

Governments, public, and private sector organisations.

We are based in
Lithuania

Project geography

Dr. Vilius Benetis

Director

About

- Dr. Vilius Benetis specialises in security operations build-out: CSIRT/SOCs incident response capability establishment or modernisation for nations, regions, sectors, and organisations.
- Dr. Benetis is also a researcher and contributor to FIRST.Org's CSIRT Services Framework and CIS Controls. He advocates SIM3 and SOC-CMM models for CSIRT/SOC modernisation and Oxford's CMM model for national cybersecurity capacity building.
- A graduate of Kaunas University of Technology (KTU), with a BSc in Computer Science as well as a MSc and PhD in Teletraffic Engineering from the Danish Technical University.

Areas of expertise

- CSIRT/SOC establishment
- Cybersecurity resilience and governance

Credentials and memberships in professional associations

CISA | CRISC | ITU-D | GFCE B | CIS | Certified SIM3 and SOC-CMM Auditor

CYBERSECURITY@LITHUANIA MAP

Protecting the critical infrastructure of SMEs from cyber-attacks

Were you negligent or were you just victim?

If you are SME and negligent, how much you should to be punished?

- You are punished by criminals
- Should you be punished by law as well?

Depends on the rules/culture/laws

- What are cybersecurity culture? Does it draw line what is good-enough cybersecurity?
- IS there anything what means REASONABLE CYBERSECURITY ???
- Typical Attacks on SMEs:
 - Ransomware via vulnerable infrastructure
 - Email or Websites Phishing (BEC, credential harvesting via infostealers, ..)
 - Hacked infrastructure for reuse of other attacks (supply chain, C&C, malware distribution)

Reasonable Cybersecurity: CIS Controls 8.1 Implementation Group 1

Factors Affecting Implementation

	 Size and/or Complexity	 Data Types	 Resources and Technology	 Threat Types	 Risk
	CHARACTERISTICS				
IG1 ESSENTIAL CYBER HYGIENE	- Small and medium-sized enterprises - Starting point for all enterprises	- Data is low sensitivity - Stores unregulated employee and company financial information - No regulatory or compliance oversight	- Limited cybersecurity expertise, may outsource IT/cybersecurity needs - Uses existing and/or cost-effective technology and processes - Uses Commercial off-the-Shelf (COTS) products	Exposed to general, non-targeted attacks (e.g., Ransomware, Malware, Web Application Hacking, Insider and Privilege Misuse)	- Limited tolerance for downtime - Focus is to keep business operational
IG2	- Enterprises managing IT infrastructure spanning multiple departments with differing risk profiles - Increased operational complexity	- Stores and processes sensitive client or enterprise information - Pockets of regulatory or compliance oversight	- Implements enterprise-grade technology - Has specialized expertise to install and properly configure software - Use COTS products, and may be using proprietary/in-house software	- Exposed to more advanced cyber threats, resulting in a loss of public trust - Exposed to industry-specific threats	- Faces an increased risk exposure (probability x potential losses) - Can withstand short interruptions of service - Concern is loss of public trust if a breach occurs
IG3	- Large enterprises that are operationally complex - Increased risk profile across the enterprise	- Stores and processes sensitive and confidential data - Subject to regulatory and compliance oversight	- Employs security experts that specialize in various areas of cybersecurity - Likely using software designed in-house or proprietary to the enterprise, in addition to COTS products - Ability to purchase dedicated cybersecurity software for specific tasks	- Exposed to sophisticated and targeted attacks, including zero-day attacks and/or nation-state threat actors - Successful attacks can cause significant harm to the public welfare	- Faces the highest risk exposure - Cannot withstand interruptions of service

Logic on CIS IG1:

Figure 6 | Threat Type factors impacting IG selection

Threat Types

IG1	▪ Exposed to general, non-targeted attacks (e.g., Ransomware, Malware, Web Application Hacking, Insider and Privilege Misuse)
IG2	▪ Exposed to more advanced cyber threats, resulting in a loss of public trust ▪ Exposed to industry-specific threats
IG3	▪ Exposed to sophisticated and targeted attacks, including zero-day attacks and/or nation-state threat actors ▪ Successful attacks can cause significant harm to the public welfare
